

Paddock to Reef Program Monitoring and Modelling Catchment Modelling – Fine sediment in the Fitzroy region

Australian Government

Outline

- Why we use models
- Paddock to Reef program
- Outline how we model
- How do we know the models are useful
- Examples of model outputs – fine sediment

Why model, and not just use monitoring?

- Pollutant loads vary with climate
- Load reductions due to improvement management practice
- Explore future scenarios
 - what will happen if we change management practices

Example

Monitoring provides:

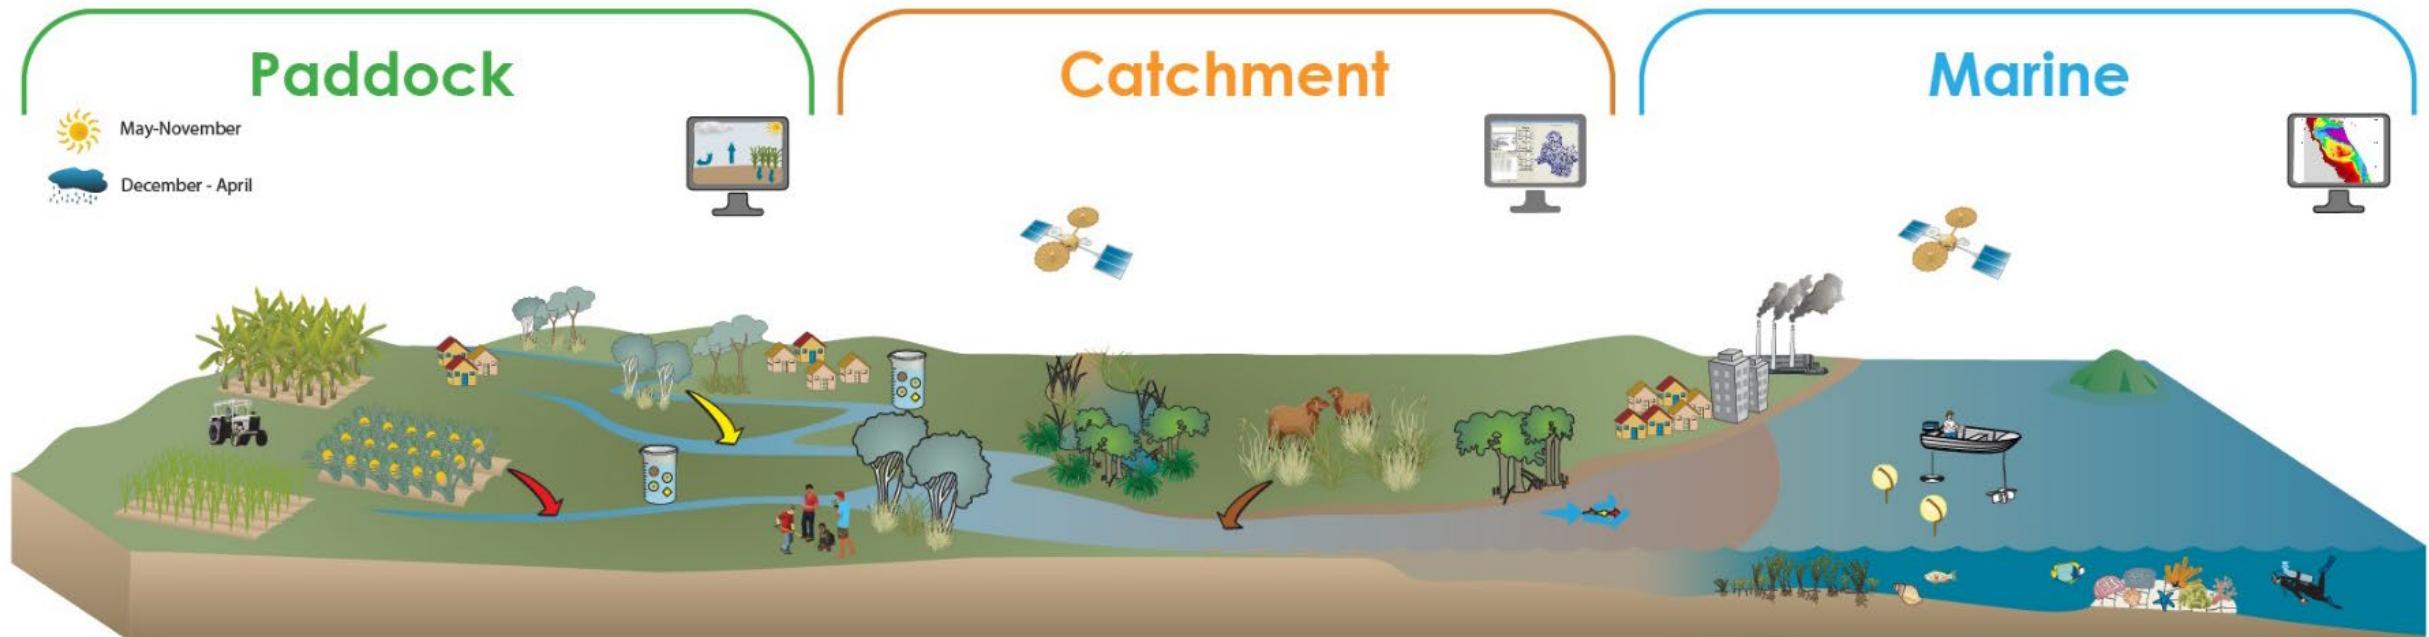

- Pollutant concentration
- Total pollutant load

Modelling can help answer:

- What is the catchment source of the sediment and nutrients in this plume?
- What happens if I change management practice in the catchment?
- What is the impact in terms of reduced loads?
- Will the change impact this event type?

Paddock to Reef Integrated Modelling, Monitoring and Reporting Program

Agriculture

- Paddock monitoring
- Paddock modelling

Catchment monitoring

Catchment modelling

Catchment indicators

- Riparian extent
- Wetland condition
- Wetland extent
- Ground cover

Seagrass monitoring

Water quality monitoring

Coral monitoring

eReefs marine modelling

Stewardship

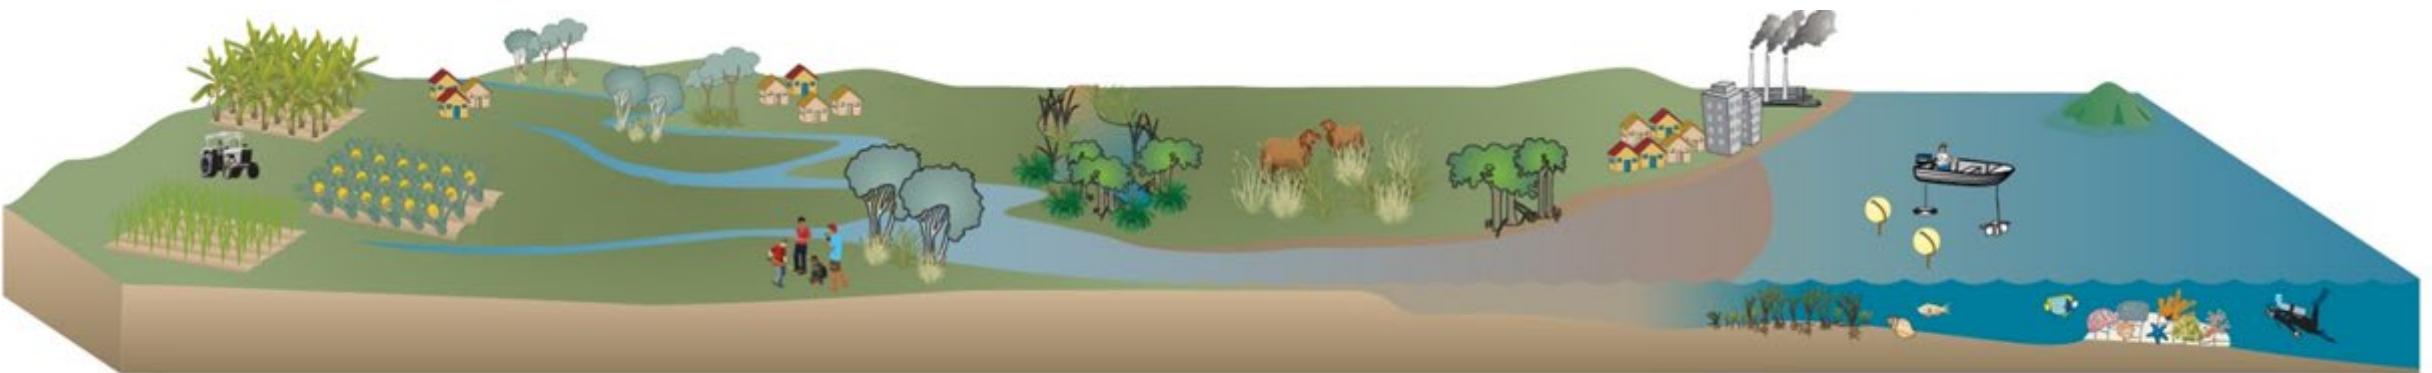

- Agriculture
- Urban
- Industrial
- Public lands

How do Catchment models work?

Baseline Model

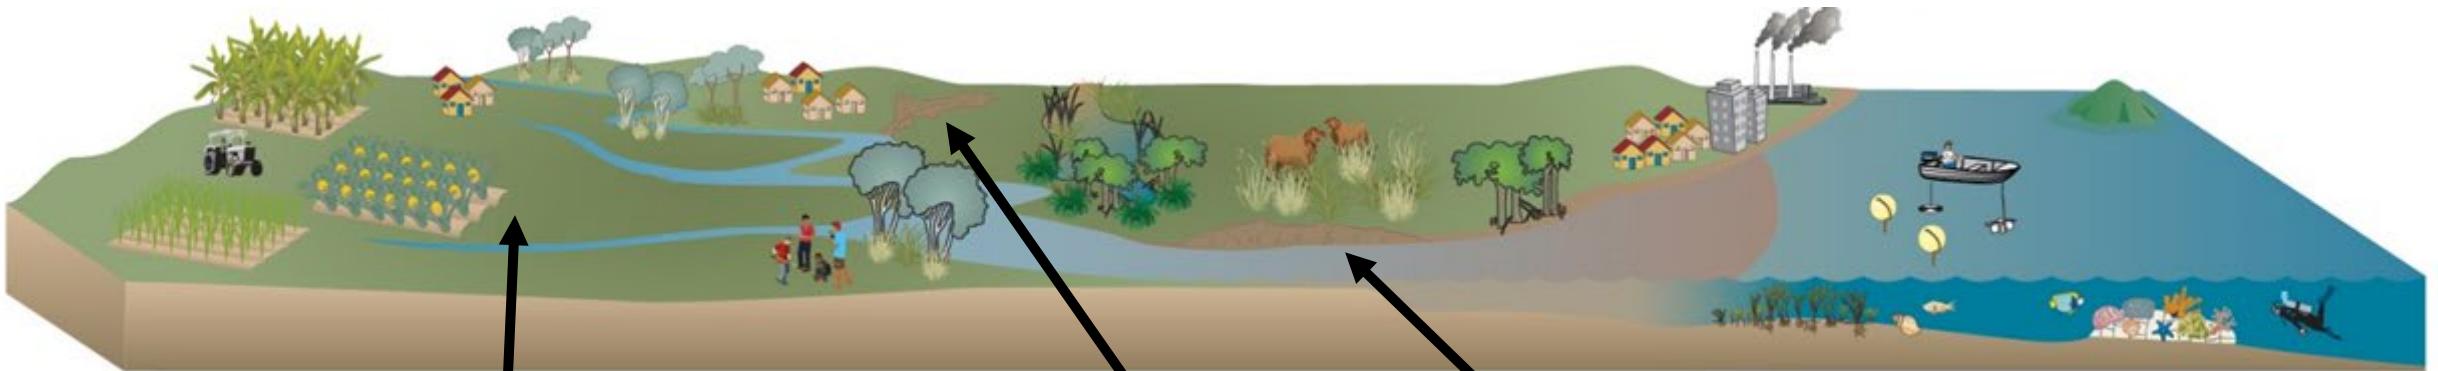

28 year Climate Period

How do Catchment models work?

Baseline Model

Hillslope Erosion

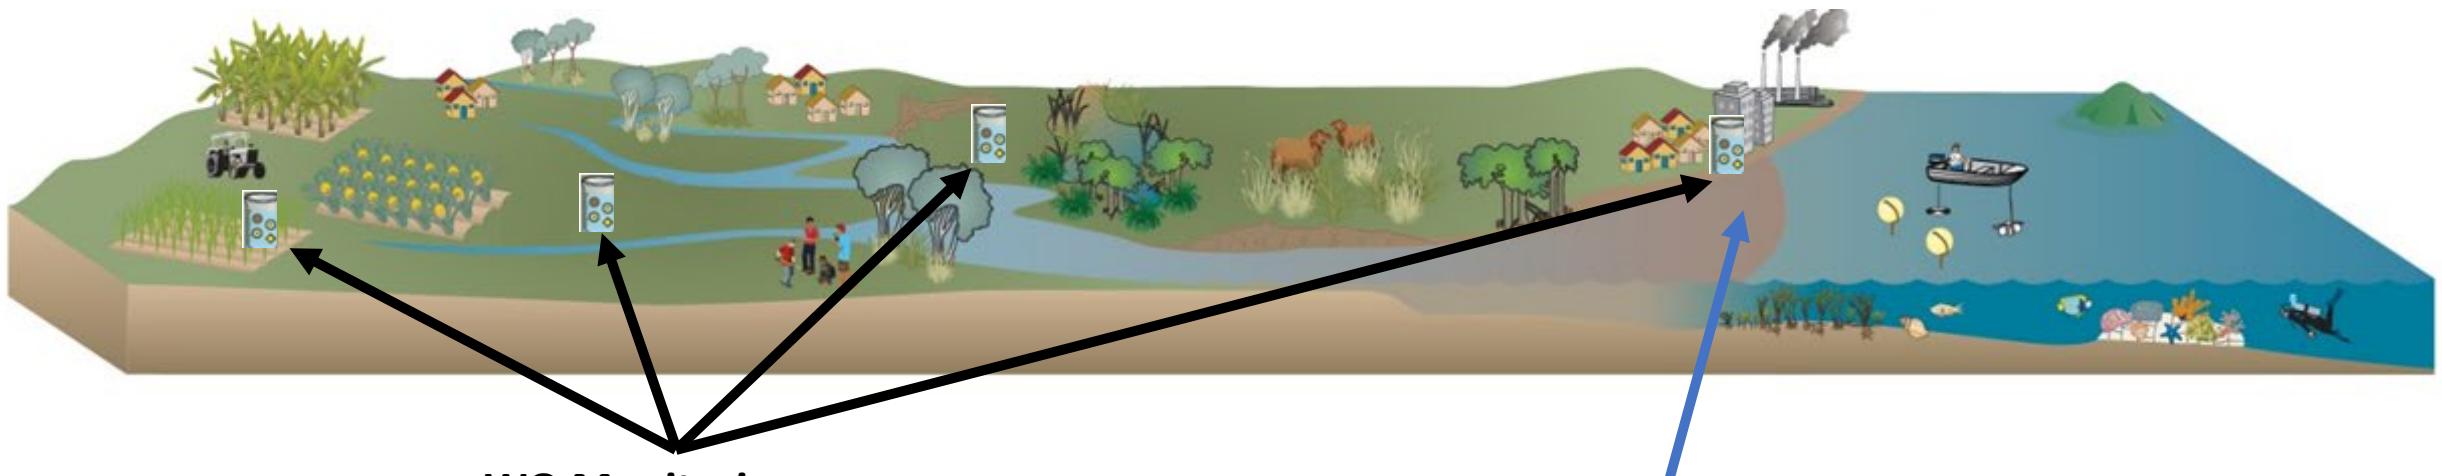

Gully Erosion

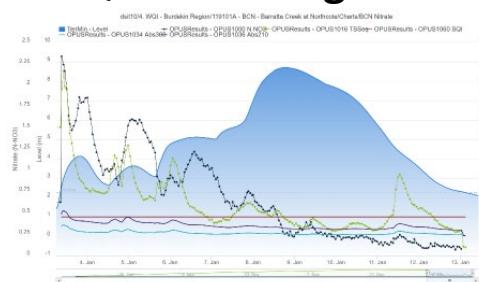

Streambank Erosion

How do Catchment models work?

Baseline Model

WQ Monitoring

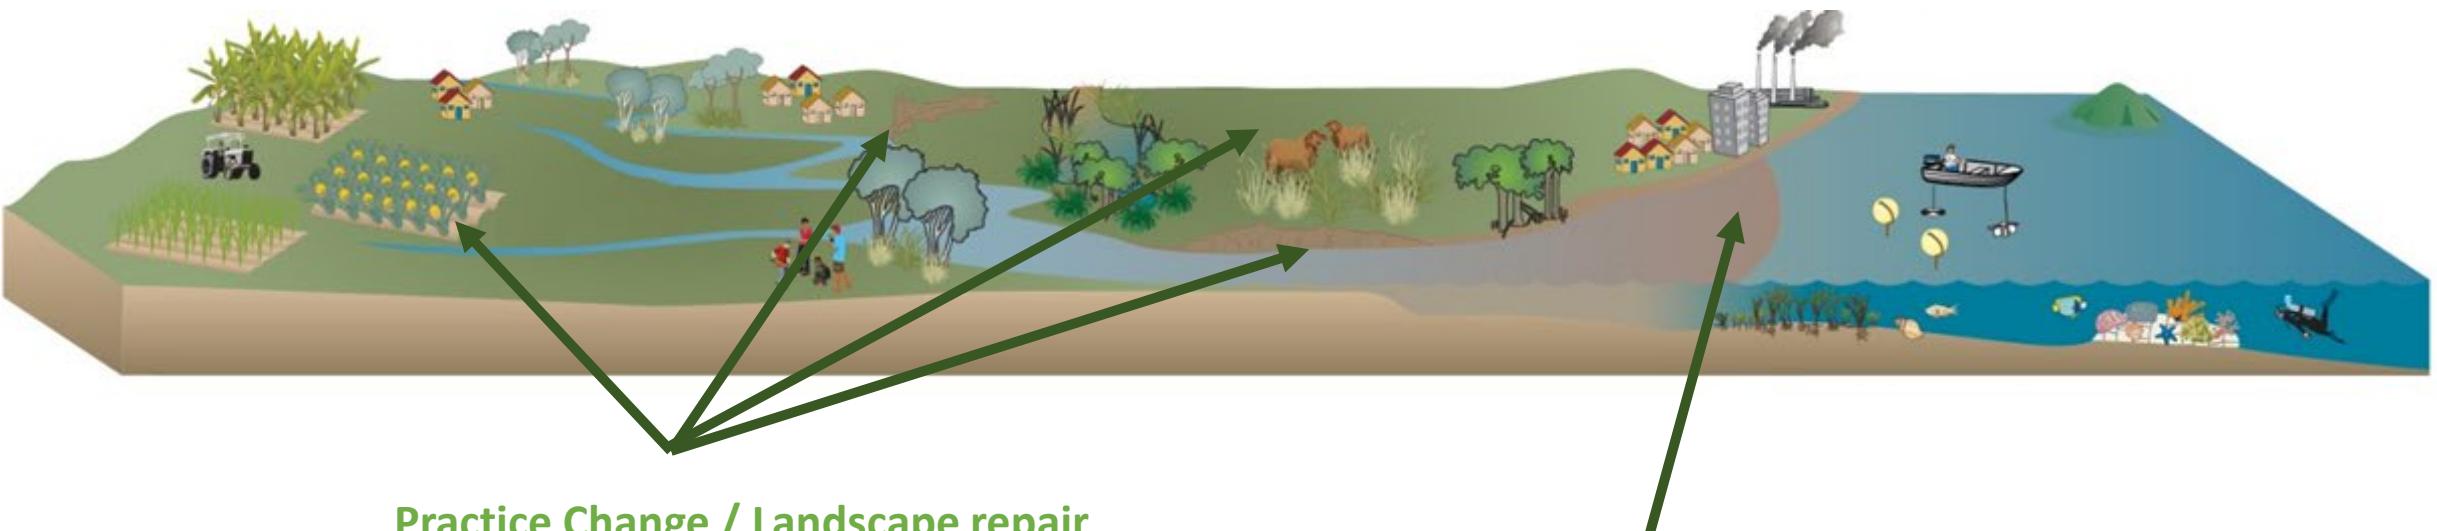

- Site
- Catchment
- End of System

Basin Average Annual Loads

- **Baseline**
 - Fine sediment
 - Nutrients
 - Pesticides

How do Catchment models work?

Change Model

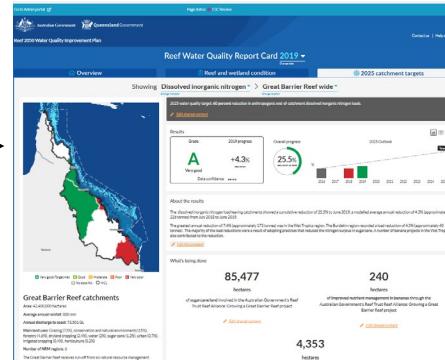

Practice Change / Landscape repair

- Improved fertiliser application
- Improved grazing practices
- Gully rehabilitation
- Streambank rehabilitation
- ...

Basin Average Annual Loads

- **Change Load**
 - Fine sediment
 - Nutrients
 - Pesticides

Reef Water Quality Report Card

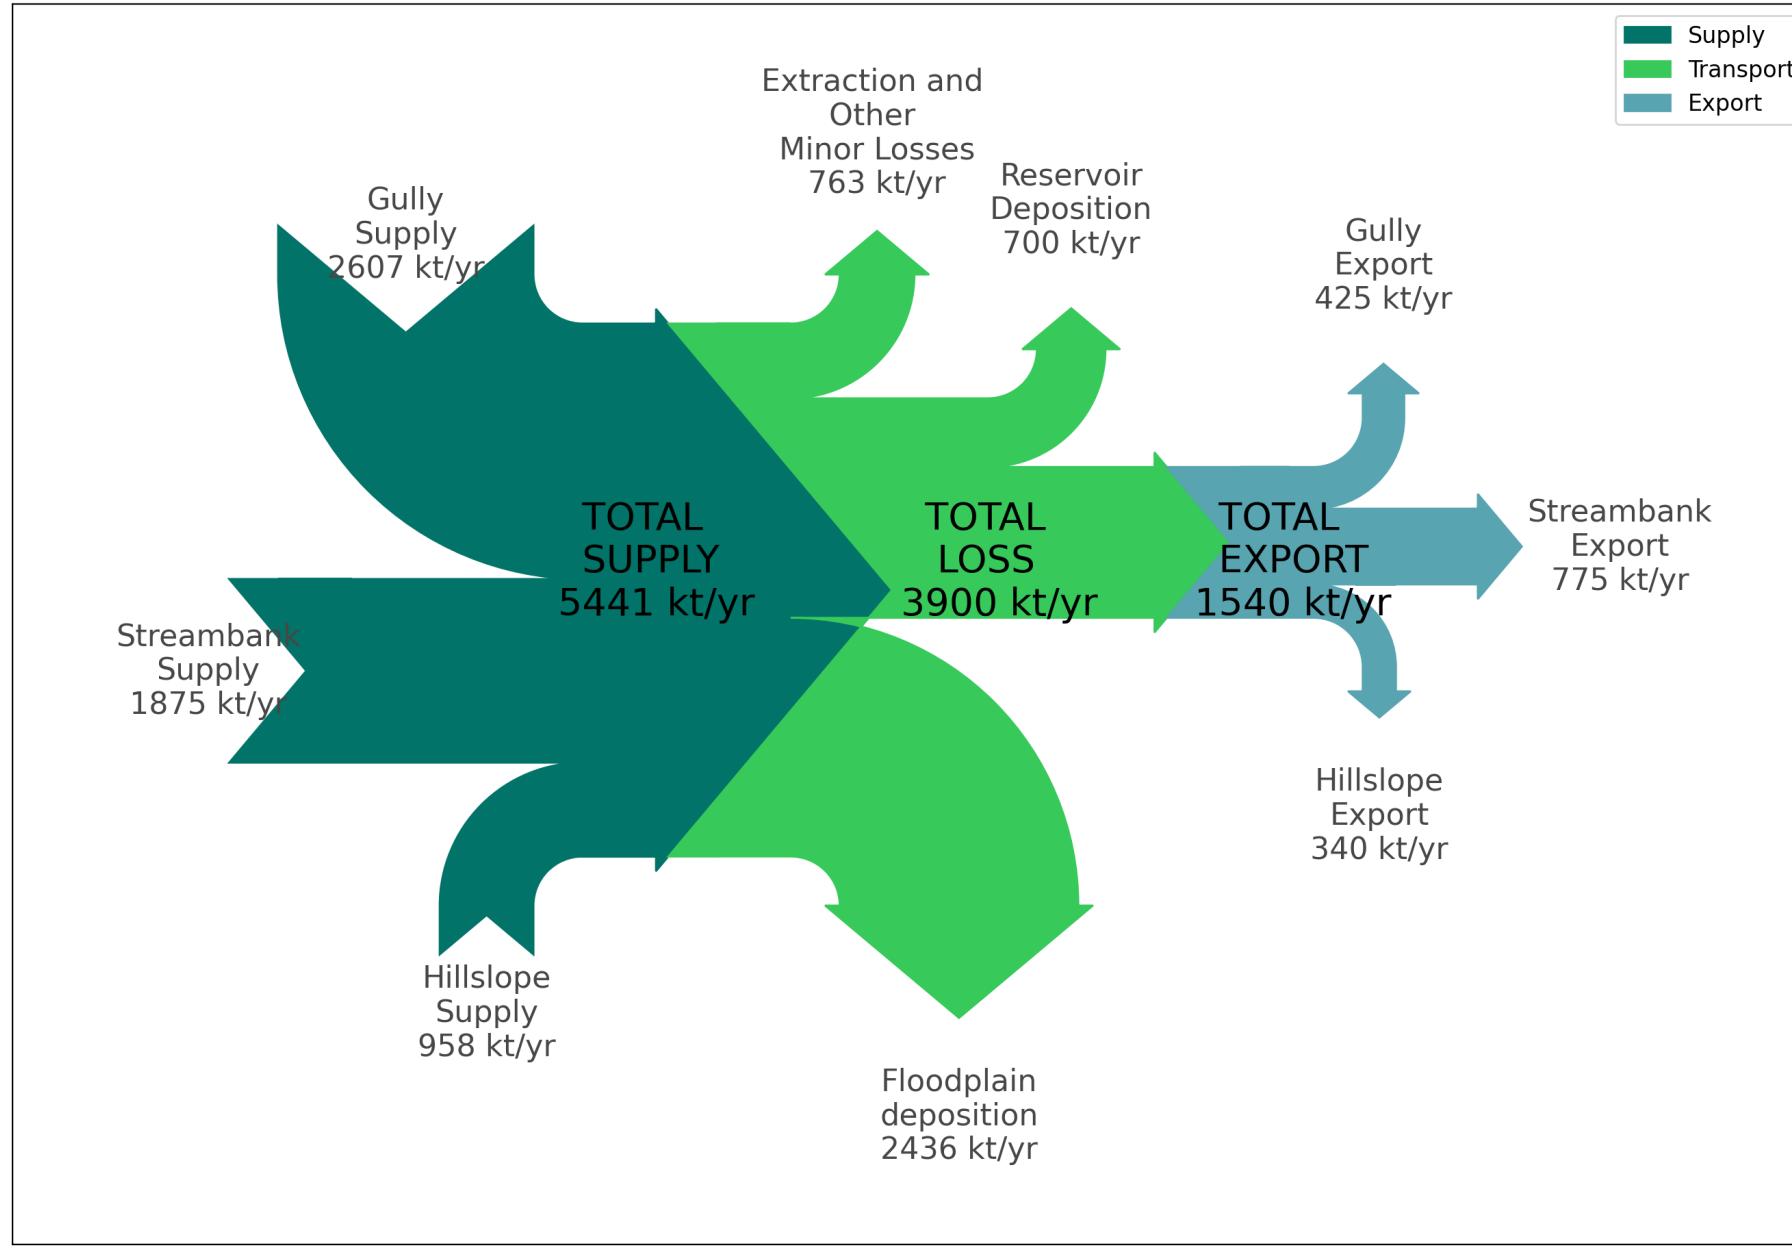

Baseline – Change = Load Reduction

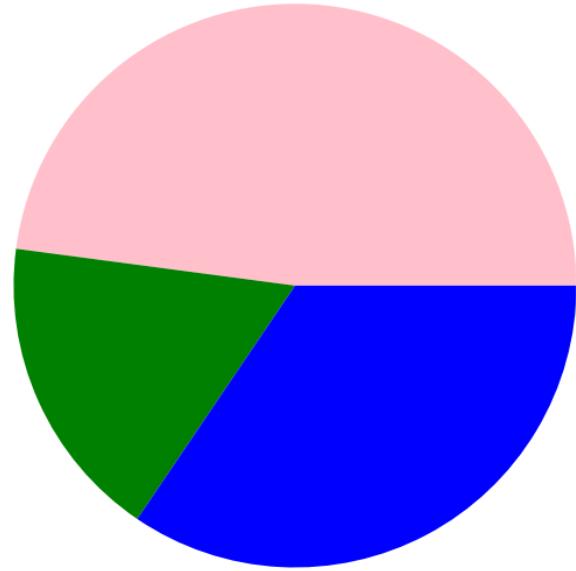

Model Results

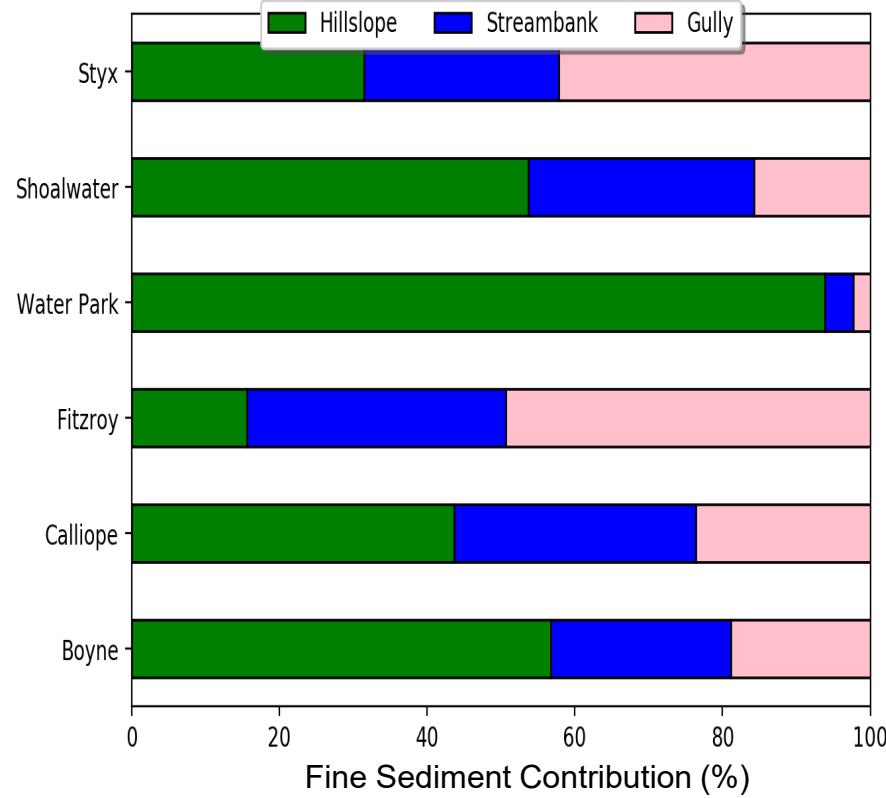

Model Outputs: Fitzroy Fine Sediment Budget

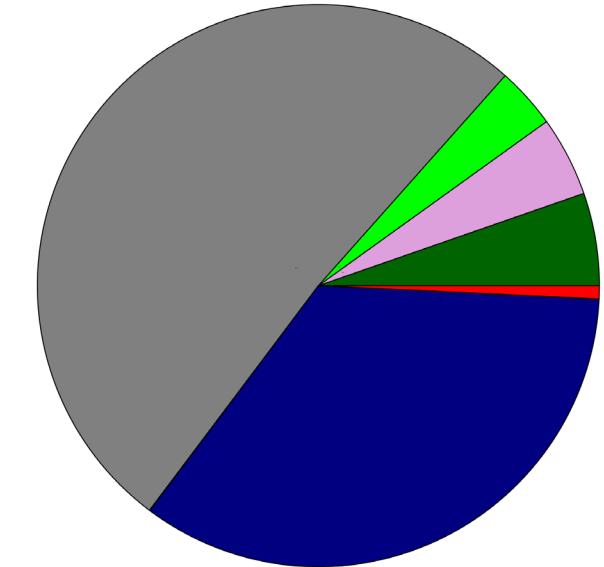

Model Outputs: Fine sediment supplied to stream

Contribution by Process

Contribution by Process

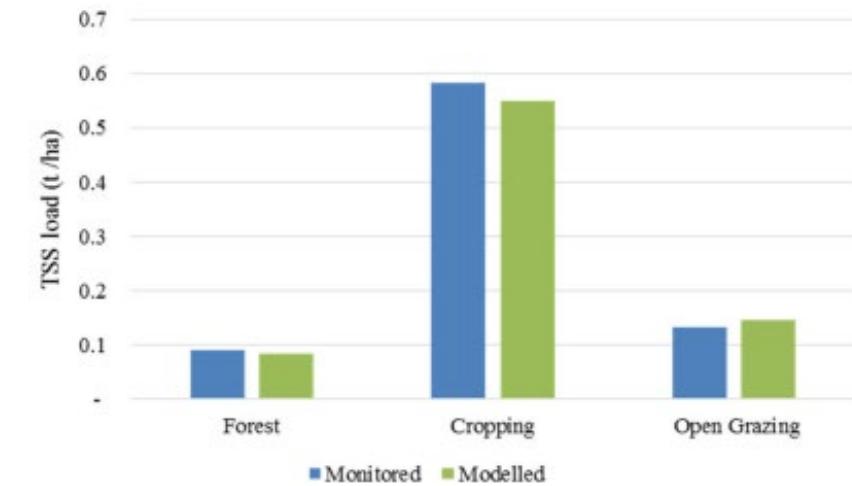

Contribution by land use

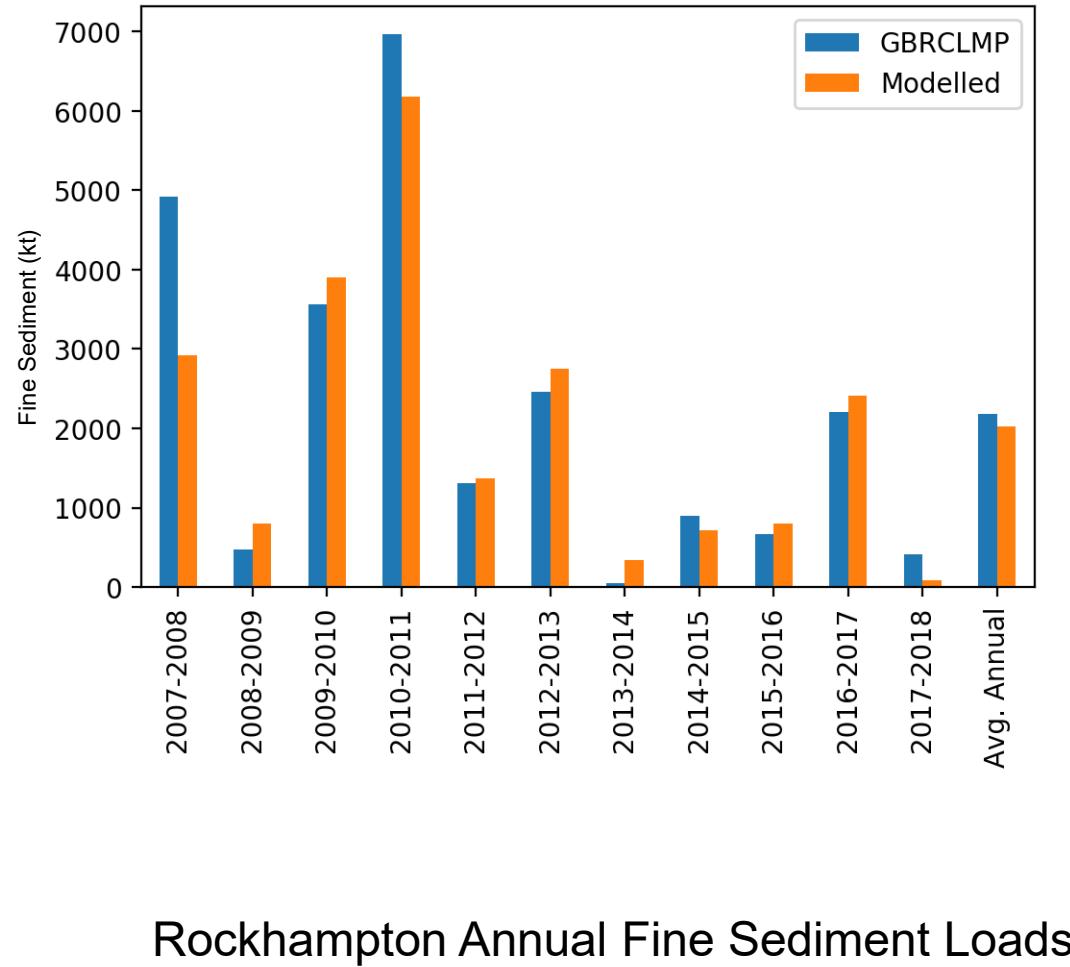

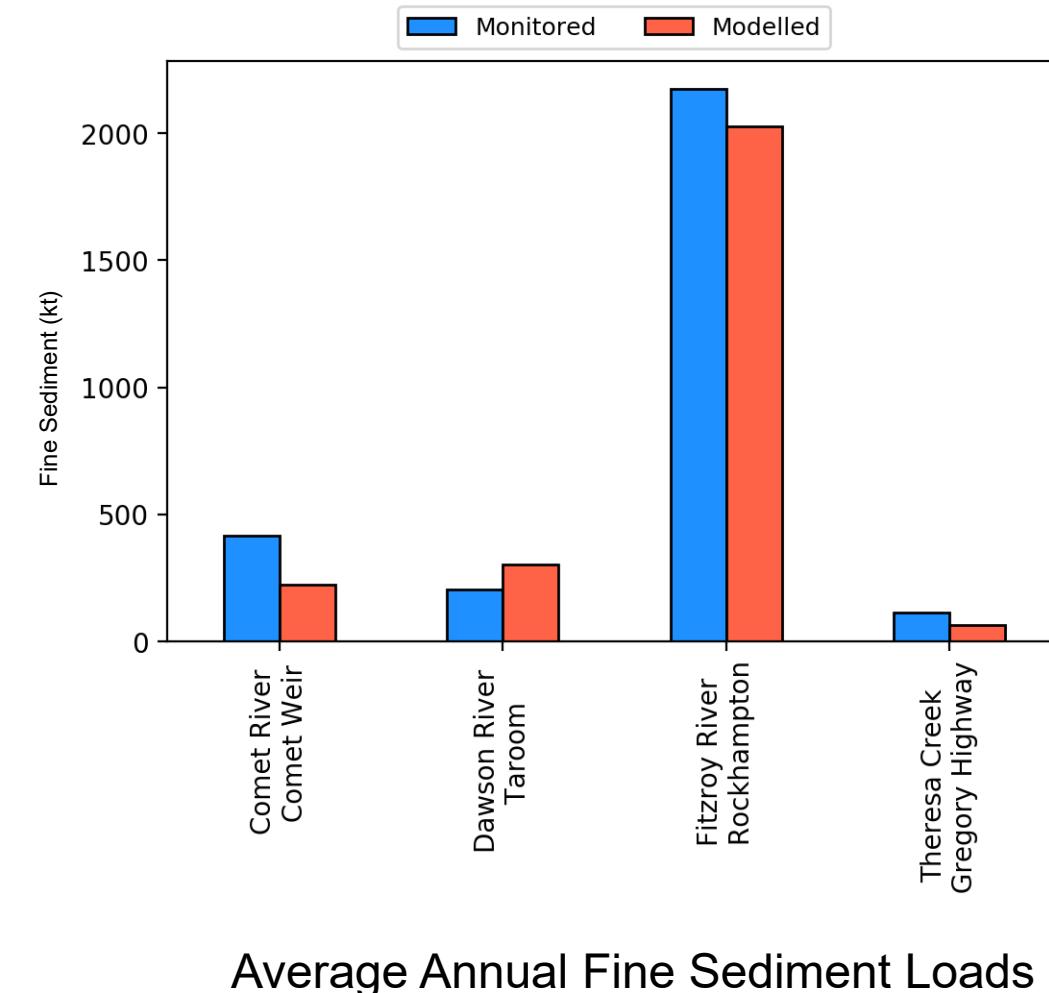

Model Validation

Baseline Validation: Site based (Brigalow Research Station)

Baseline Validation: Regional

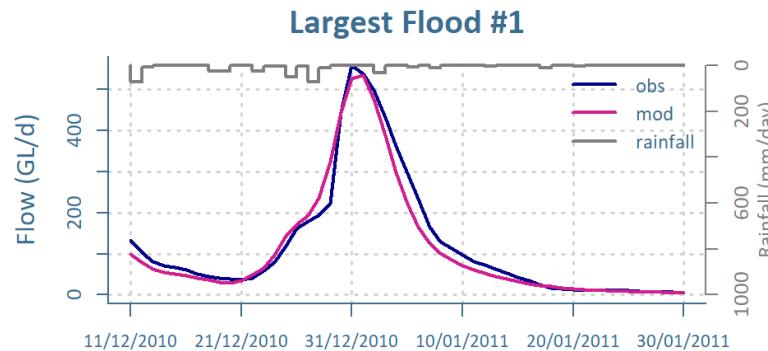

Baseline Validation: Event

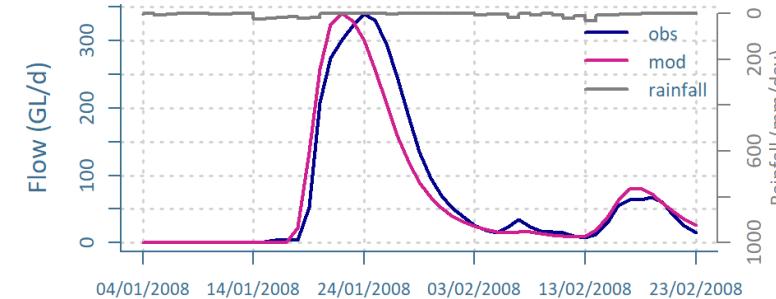

Event Analysis

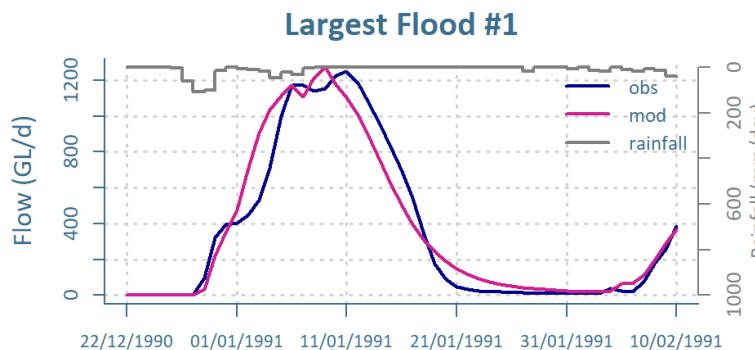

Mackenzie River at Riley's Crossing (130113A)

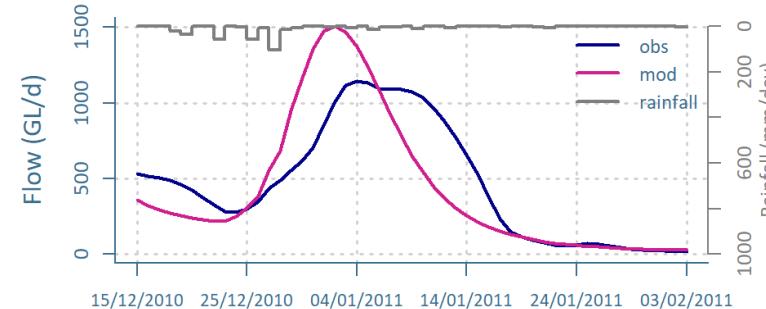

Largest Flood #2

Fitzroy River at The Gap (130005A)

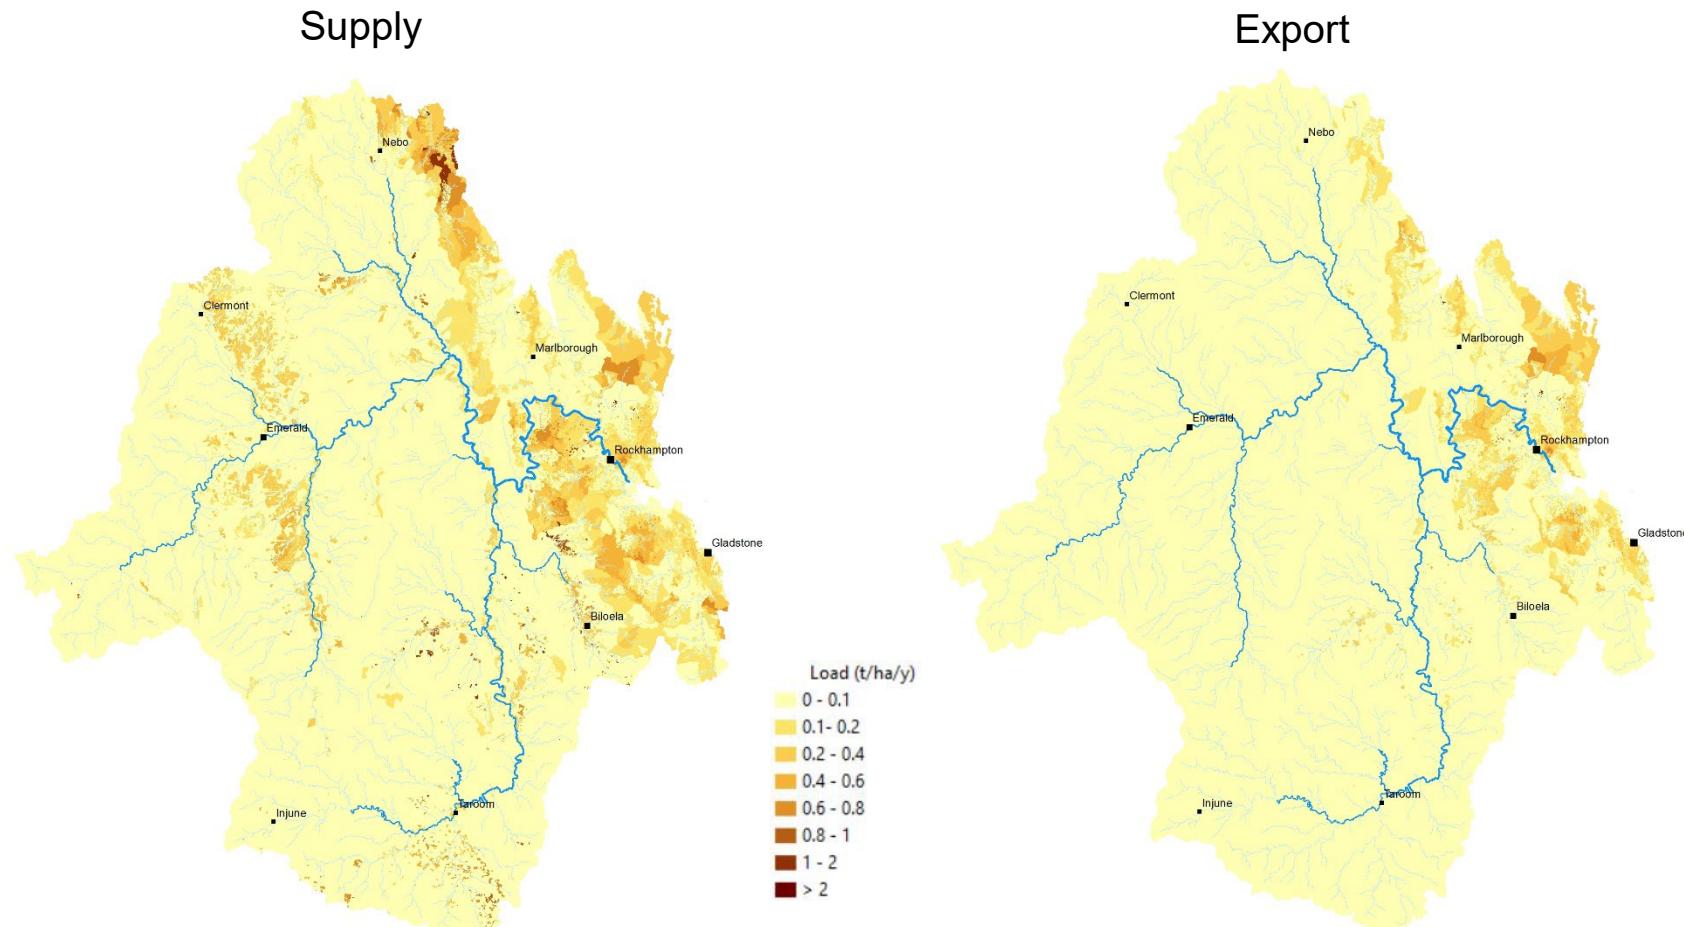

Largest Flood #2

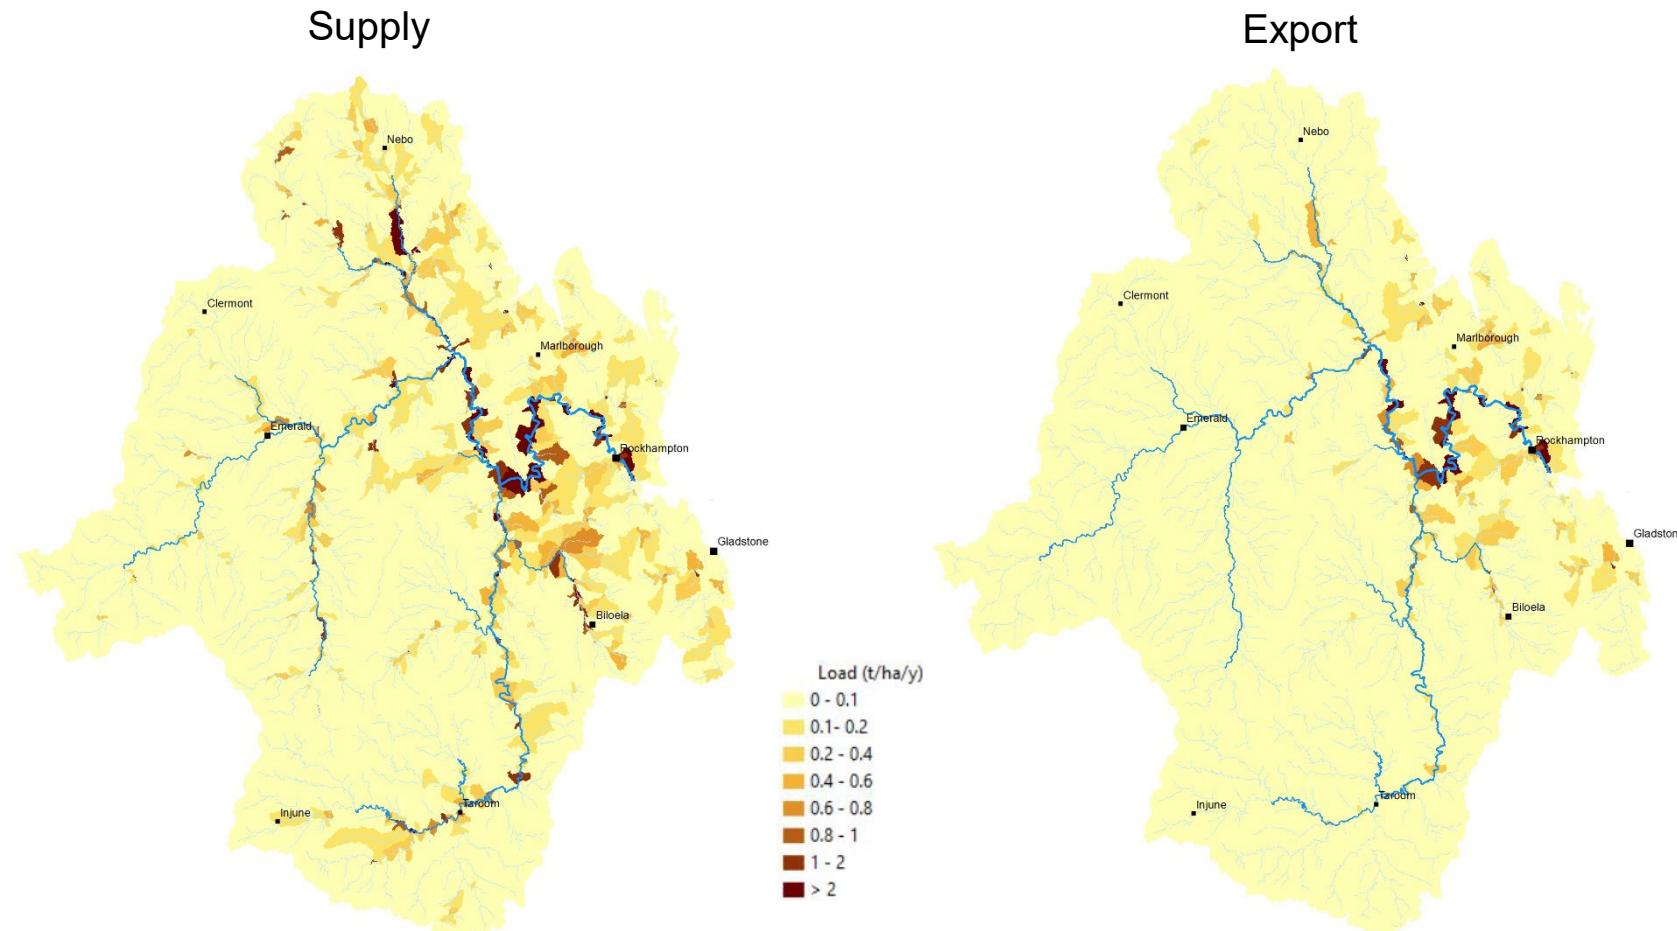

Model Outputs

Model Hot Spots: Hillslope Erosion

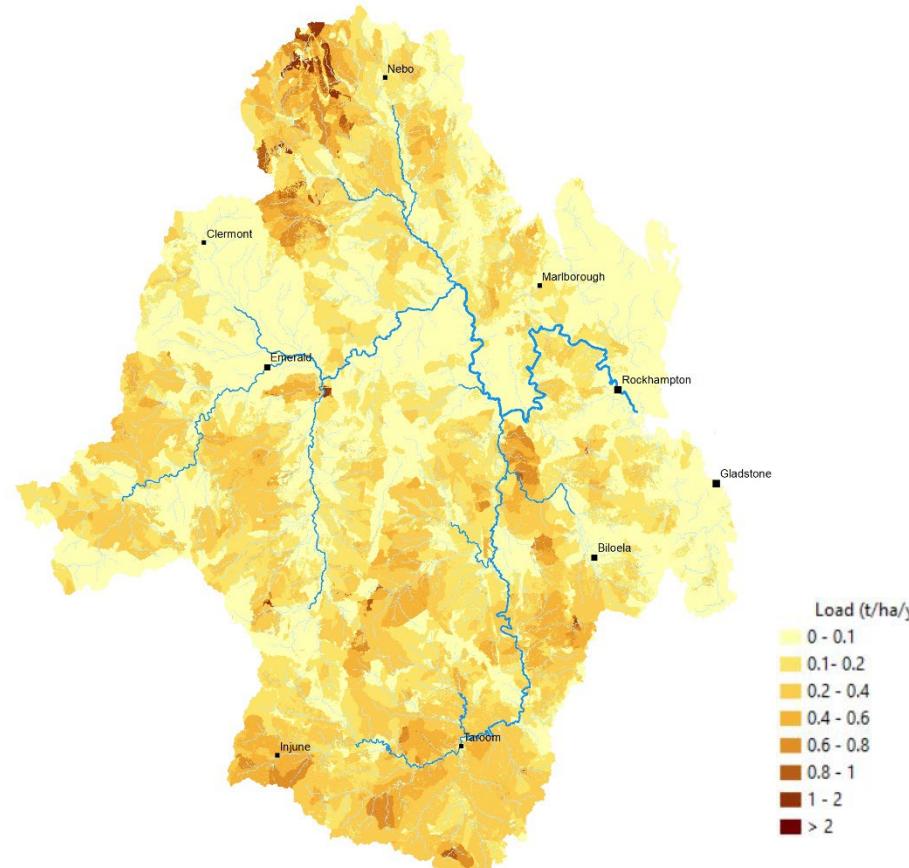

Model Hot Spots: Streambank Erosion

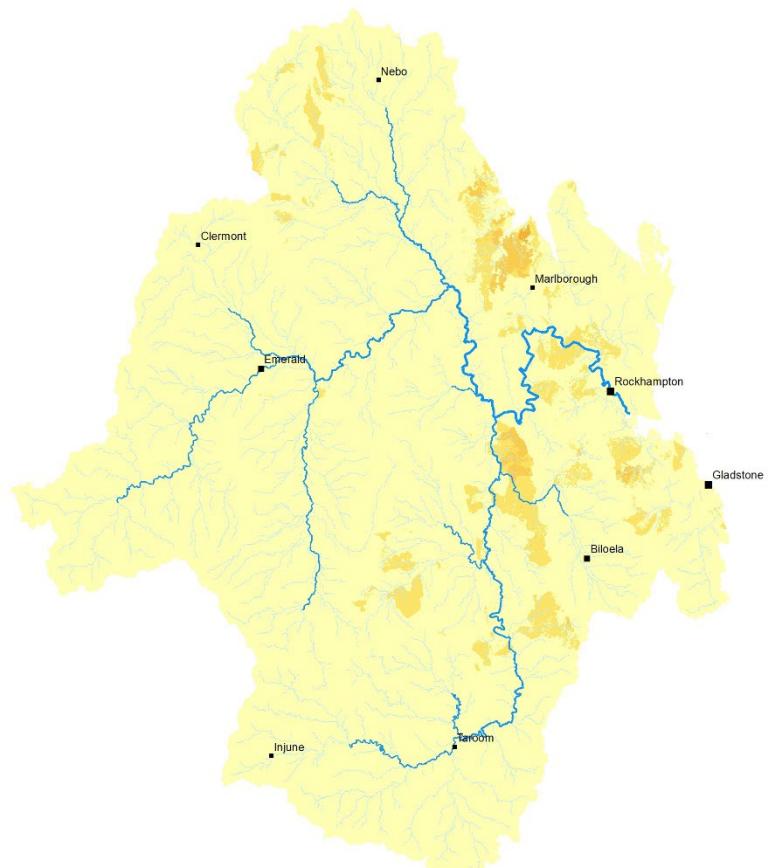

Model Hot Spots: Gully Erosion

Supply

Export

Model Hot Spots: Total Load
